

AIRouter.ai Quick Start Guide v1.0

AIRouter.ai

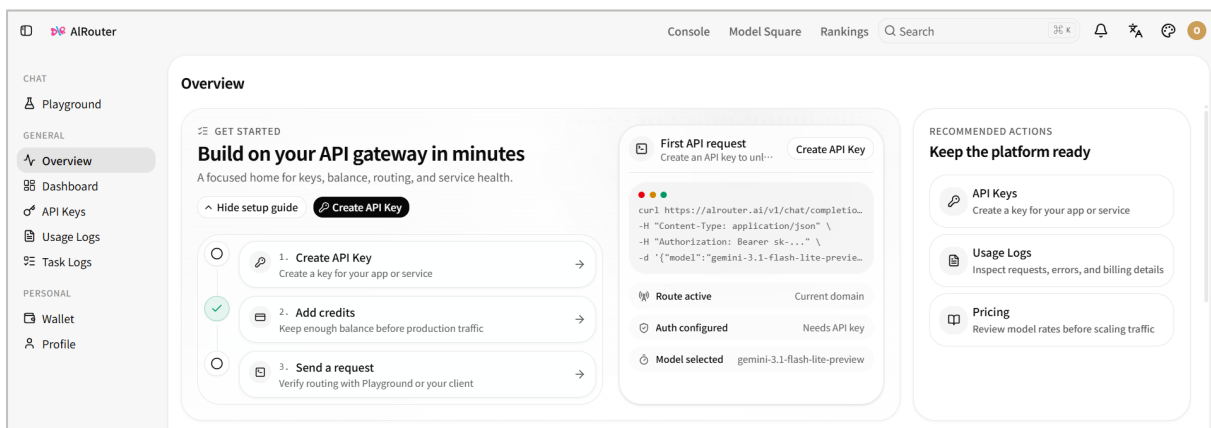

⚡ Quick Start

1. Create an Account

AIRouter is available only to users in a contracted domain. If you belong to that domain, contact your administrator to request your account credentials.

2. Sign In

Open a web browser and go to <https://airouter.ai>. After a successful sign-in, the Overview dashboard will appear.

3. Get Started with AIRouter

Complete the following three steps to start using AIRouter.

1 Generate an API Key

AIRouter Dashboard>API Keys menu, click the  button to generate a key. For detailed steps, refer to the User Manual.

```
# Set the issued key as an environment variable

export ALROUTER_API_KEY="sk-xxxxxxxxxxxxxxxxxxxxx"
```

💡 Your API key is shown only once. Store it in a secure location immediately after generation.

2 Token Usage Fee Balance

AIRouter Dashboard>Wallet>Current Balance menu, click the view the token usage fee balance set by your administrator. If your balance is insufficient, contact your administrator to request a top-up.

💡 You can set monthly spending quotas per team member (e.g., \$50/month) in the dashboard to prevent overages.

3 Send a Request

Verify routing via the Playground or your client. ARouter provides an OpenAI-compatible endpoint.

```
# OpenAI SDK example — only base_url needs to change

from openai import OpenAI

client = OpenAI(

    api_key="sk-xxxxxxxxxxxxxxxxxxxx",

    base_url="https://alrouter.ai"

)

response = client.chat.completions.create(

    model="gpt-5-mini", # or claude-sonnet-4.6, gemini-3.1-pro

    messages=[{"role": "user", "content": "Hello!"}]

)

print(response.choices[0].message.content)
```

💡 Simply swap AllRouter as the base_url and your existing OpenAI code works as-is.

 **You're All Set — One Key for Every Model**

Call GPT, Claude, and Gemini through a single API, and monitor per-team usage and costs in real time from the dashboard.
